7080 STORAGE DISCRIMINATION TEST

April 15, 1961

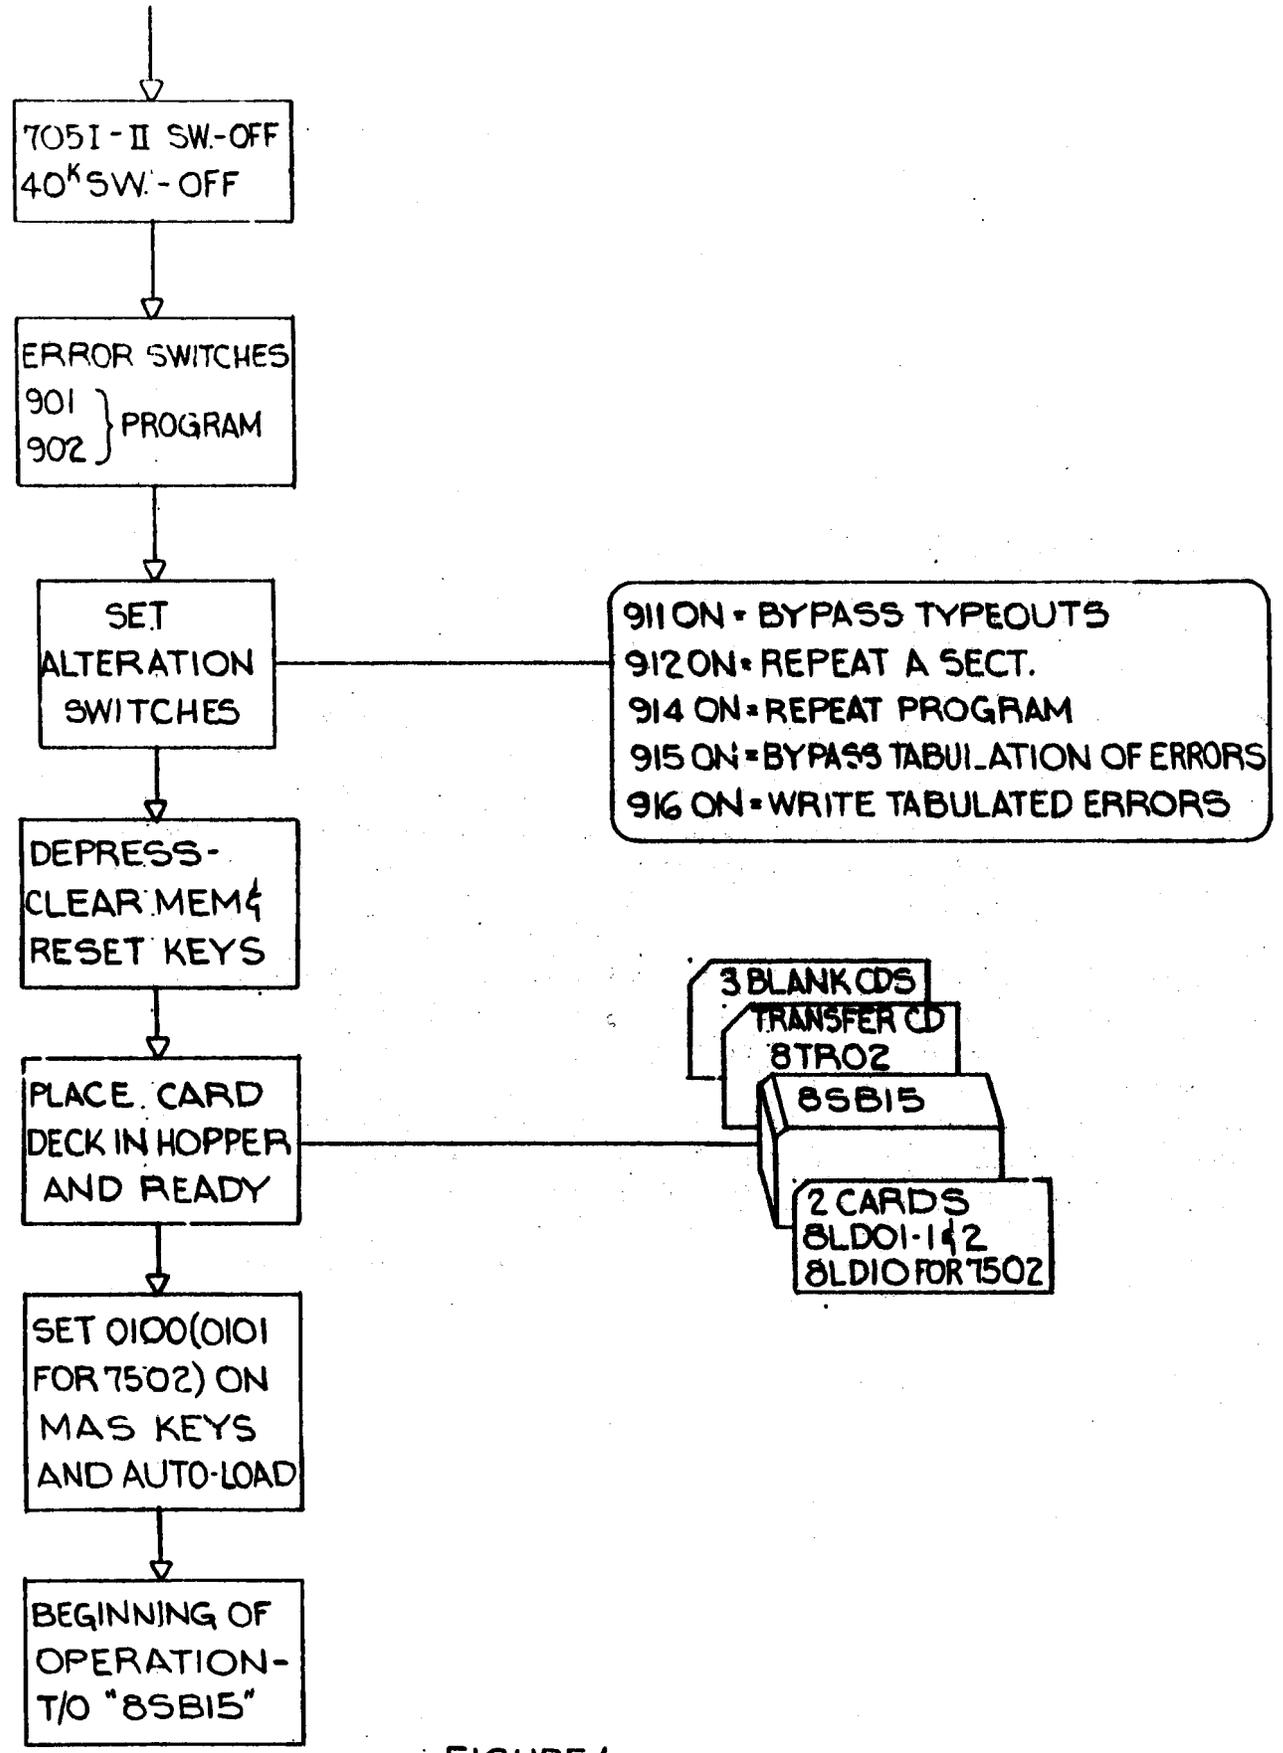

FIGURE 1
MACHINE SET-UP FOR 85B15

7080 STORAGE DISCRIMINATION TEST**I. UNIT TESTED:**

7305 Central Storage Unit

II. PURPOSE OF TEST:

To determine if data placed in storage may be recovered unchanged.

III. METHOD OF TEST:**A. General**

The test is divided into twelve sections, each having a specific test pattern. In each of these the character to be tested is determined by a SPC instruction preceding a UFC. Of the four characters thus unloaded, only the low order (units position) character is tested. The SPC address is incremented by one and another for characters unloaded.

The character's bit breakdown is determined and if it differs from that expected the results are used to set up the section error typeout.

There is a tabulation routine which services all twelve sections. If alteration switch 0915 is off it will take the errors and classify them in three ways:

1. In which character (0-7) did the errors occur? Which bit(s)? Were they picked or dropped?
2. In which word (0-3) did the errors occur? In which set (0-7)? How many bits were picked and/or dropped?
3. In which bank did the errors occur? How many bits were picked and/or dropped?

B. Sections 1 Through 10

A 256 character pattern is created in memory and all banks are loaded. Each character is unloaded and tested as above.

C. Sections 11 Through 12

Storage is loaded and tested as described in B. A word is complemented and its eight characters tested. It is then recomplemented and the next word processed,

D. Patterns Used

1. Section 1 - Ones Discrimination

Ones in all bit positions of storage.

Section 2 - Zeros Discrimination

Zeros in all bit positions of storage.

Section 3 - Alternate Word Discrimination

Alternate words have all bits on or off starting with word zero on.

Section 4 - Alternate Word Discrimination

Complement of Section 3 starting with word zero off.

Section 5 - Alternate Word and Character Discrimination

Each word consists of alternate all bit and no bit characters. Adjacent words start with opposite characters. Word zero starts with an all bit character.

Section 6 - Alternate Word and Character Discrimination

Complement of Section 5 formed by starting word zero with a no bit character.

Section 7 - Alternate Word Character and Bit Discrimination

Each character consists of alternate bits on and off. Adjacent characters in any word start with opposite bits. Adjacent words start with opposite characters. The first bit of word zero is on.

Section 8 - Alternate Word, Character, and Bit Discrimination

Complement of Section 7 formed by starting word zero with the first bit off.

Section 9 - Alternate Sets Discrimination

Each set consists of 32 all bits or 32 no bits characters. Alternate sets are opposites. Set zero is all bits.

Section 10 - Alternate Sets Discrimination

Complement of Section 9 formed by starting with set zero, no bits.

Section 11 - Ones Discrimination, Complemented

Ones in all bit positions of storage complemented by eight no bit characters and recomplemented before leaving the word.

Section 12 - Zeros Discrimination, Complemented

Zeros in all bit positions of storage complemented by eight all bit characters and recomplemented before leaving the word.

E. Running Time

One complete pass (12 Sections) of 8SB15 takes approximately 7 sec. if there are no errors.

A. Units

- 1. 7305 Central Storage
- 2. 7102 CPU
- 3. Typewriter and Printer (optional)
- 4. Card Reader or Tape

B. Memory Locations

- 1. 0000 to 18,000 and 19,000 to 37,000

V. LOADING PROCEDURE

A. Tape Input (STR06 Generated Test Tape)

Refer to STR06 write-up for loading and running procedure.

B. Card Input

1. Deck Structure

714

8LD01 2
 8SB15 599
 STR02 1
 Blanks 3

Console Card Reader (7502)

8LD10 2 cards
 8SB15 599 cards
 STR02 1 card
 Blanks 3 cards

2. Start Procedure

SEL 2 0100
 "Auto Load"

SEL 2 0101
 "Auto Load"

VI. PROGRAM CONTROL

A. Check Switches

901 and 902 program

B. Alteration Switches

- 0911 ON - Bypass section error and end section typeouts.
- 0912 ON - Repeat a section
- 0914 ON - Repeat Program
- OFF - Go to transition program (8TR06)

- 0915 ON - Bypass tabulating errors
- 0916 ON - Write tabulated errors.

This switch is interrogated at the end of each section. It is also interrogated after the character-bit tabulation heading, after the character-bit tabulation, and after the word-set tabulation heading. If it is off at any of these points, the remainder of the tabulation is bypassed and the field is reset.

C. Halts

- 0000 Occurs after the typeout "901-2 TO PROGRAM"
 "Start" to continue
- 0001 Occurs in the event of an improper transfer to the
 tabulation routine.
 "Reset" and "Start" to try again.

VII. PRINTED RESULTS**A. General**

There are five possible typeouts:

1. "901-2 TO PROGRAM" no bypass.
2. Section error typeout 0911 - ON bypass.
3. End section typeout 0911 - ON bypass.
4. Pass count typeout no bypass.
5. Tabulation 0916 - OFF bypass at four
 places - see VI - B.

B. Program Entry Typeout - "901-2 TO PROGRAM"

This will occur only once and will be bypassed automatically when the program is repeated by 0914 - ON or by "Reset" and "Start."

C. Section Error Typeout

1. Example "SPC 1301 AB D-D---- WD 044"

This can occur in Sections 1, 3, 4, 5, 6, 9, 10, 11 and 12. The first four digit number is the starting point counter position at which the error occurred. "AB" denotes that the original character had all seven bits on. The two D's show that a "C" bit and an "A" bit were dropped. "WD 044" shows that the word driver is number 044.

2. Example "SPC 1213 NB P--PP-- WD 041"

This can occur in Sections 2, 3, 4, 5, 6, 9, 10, 11 and 12. "NB" denotes that the original character had all bits off. The three P's show that a "C" bit, and "8" bit, and a "4" bit were picked. Error location is starting point counter 1213 and word driver 041.

3. Example "SPC 0002 V-A -P--D-- WD 000"

This can occur in Section 7 and 8. The original test character, a "V," has become an "A" by picking a "B" bit and dropping a "4" bit. Error location is starting point counter 0002 serviced by word driver 000.

4. Example "SPC 0010 --S -DPD--- WD 001"

This can occur in Sections 7 and 8. The original test character, a redundant minus zero (0101010), has become an "S" by dropping a "B" and an "8" bit, and picking an "A" bit. Error location is starting point counter 0010 serviced by word driver 001.

D. End Section Typeout "S-1" — "S-12)

With 0911-off this will occur at the end of each section independent of the 0912 switch setting.

E. Pass Count Typeout "Pass 00" — "Pass 99"

Cannot be bypassed. It will indicate up to 99 passes of the complete program after which it will be reset to zero.

F. Tabulation See Fig. 3

This typeout gives a total of all the bit picks and drops which have occurred in any section or combination of sections used since the last reset. It is only reset under two conditions:

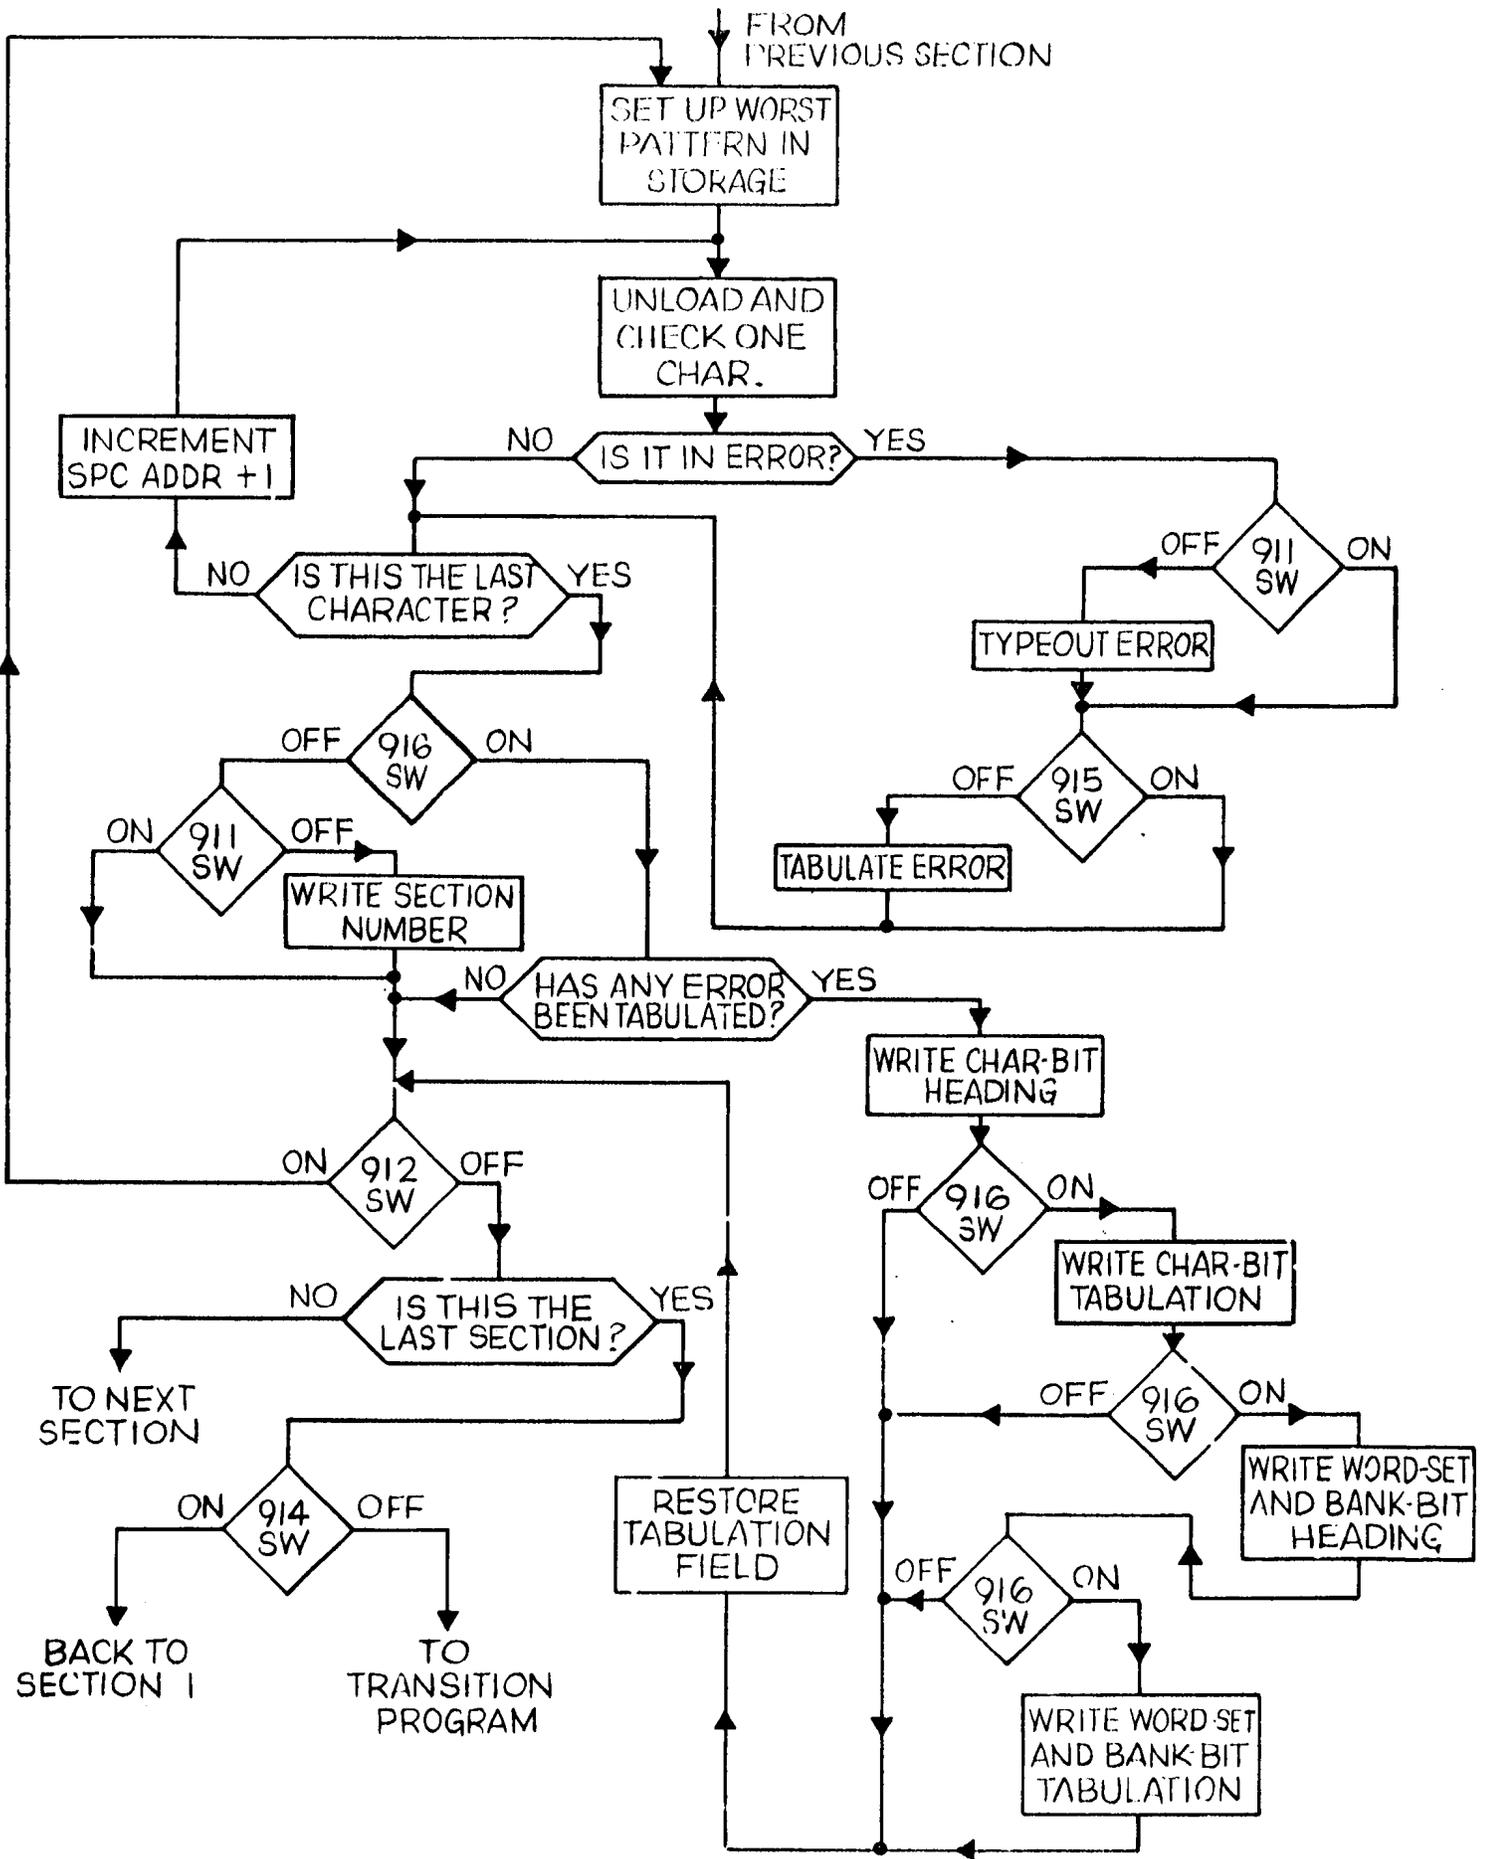

1. After typeout
2. When program is restarted by "Reset" and "Start"

With 0916 on there will be no typeout if no errors have occurred. Only those lines needed to describe an error will typeout in any case. To save time an ON line printer may be used instead of the typewriter by storing 0400 at 31076.

VIII. * COMMENTS

8SB15 is designed to test storage reliability. It will not, in general, detect addressing failures. When run with 0911 on - 0915 off - and 0916 on, it will test storage reliability for any number of passes with only one typeout per error free loop.

FIG 2 7080 BSWCB STORAGE DISCRIMINATION TEST 85B15

1	0 0	0 0	0 20	0 0	I	1	0 40

Figure 3

Example 1 above shows the largest possible tabulation typeout. It was formed by causing six drop errors in each character in storage.

Example 2 shows that only the required lines will typeout. In this case error characters were found only at SPC 0000-0003 and SPC 0120-0123. Each character had dropped 5 bits (B, 8, 4, 2, 1).
